

Module 8.1 : Bias and Variance

We will begin with a quick overview of bias, variance and the trade-off between them.

- Let us consider the problem of fitting a curve through a given set of points

The points were drawn from a sinusoidal function (the true $f(x)$)

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\begin{array}{l} \text{Simple} \\ \text{(degree:1)} \end{array} \quad y = \hat{f}(x) = w_1x + w_0$$

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\begin{matrix} \textit{Simple} \\ \textit{(degree:1)} \end{matrix} \quad y = \hat{f}(x) = w_1x + w_0$$

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\begin{array}{l} \text{Simple} \\ (\text{degree:1}) \end{array} \quad y = \hat{f}(x) = w_1x + w_0$$

$$\begin{array}{l} \text{Complex} \\ (\text{degree:25}) \end{array} \quad y = \hat{f}(x) = \sum_{i=1}^{25} w_i x^i + w_0$$

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\begin{array}{l} \text{Simple} \\ (\text{degree:1}) \end{array} \quad y = \hat{f}(x) = w_1x + w_0$$

$$\begin{array}{l} \text{Complex} \\ (\text{degree:25}) \end{array} \quad y = \hat{f}(x) = \sum_{i=1}^{25} w_i x^i + w_0$$

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\text{Simple}_{(\text{degree:1})} \quad y = \hat{f}(x) = w_1x + w_0$$

$$\text{Complex}_{(\text{degree:25})} \quad y = \hat{f}(x) = \sum_{i=1}^{25} w_i x^i + w_0$$

- Note that in both cases we are making an assumption about how y is related to x . We have no idea about the true relation $f(x)$

The points were drawn from a sinusoidal function (the true $f(x)$)

- Let us consider the problem of fitting a curve through a given set of points
- We consider two models :

$$\begin{matrix} \text{Simple} \\ (\text{degree:1}) \end{matrix} \quad y = \hat{f}(x) = w_1x + w_0$$

$$\begin{matrix} \text{Complex} \\ (\text{degree:25}) \end{matrix} \quad y = \hat{f}(x) = \sum_{i=1}^{25} w_i x^i + w_0$$

- Note that in both cases we are making an assumption about how y is related to x . We have no idea about the true relation $f(x)$
- The training data consists of 100 points

The points were drawn from a sinusoidal function (the true $f(x)$)

- We sample 25 points from the training data and train a simple and a complex model

The points were drawn from a sinusoidal function (the true $f(x)$)

- We sample 25 points from the training data and train a simple and a complex model
- We repeat the process ' k ' times to train multiple models (each model sees a different sample of the training data)

The points were drawn from a sinusoidal function (the true $f(x)$)

- We sample 25 points from the training data and train a simple and a complex model
- We repeat the process ' k ' times to train multiple models (each model sees a different sample of the training data)
- We make a few observations from these plots

- Simple models trained on different samples of the data do not differ much from each other

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)

- Simple models trained on different samples of the data do not differ much from each other
- However they are very far from the true sinusoidal curve (under fitting)
- On the other hand, complex models trained on different samples of the data are very different from each other (high variance)

- Let $f(x)$ be the true model (sinusoidal in this case) and $\hat{f}(x)$ be our estimate of the model (simple or complex, in this case) then,

$$\text{Bias}(\hat{f}(x)) = E[\hat{f}(x)] - f(x)$$

Green Line: Average value of $\hat{f}(x)$
for the simple model

Blue Curve: Average value of $\hat{f}(x)$
for the complex model

Red Curve: True model ($f(x)$)

- Let $f(x)$ be the true model (sinusoidal in this case) and $\hat{f}(x)$ be our estimate of the model (simple or complex, in this case) then,

$$\text{Bias}(\hat{f}(x)) = E[\hat{f}(x)] - f(x)$$

- $E[\hat{f}(x)]$ is the average (or expected) value of the model

Green Line: Average value of $\hat{f}(x)$
for the simple model

Blue Curve: Average value of $\hat{f}(x)$
for the complex model

Red Curve: True model ($f(x)$)

Green Line: Average value of $\hat{f}(x)$
for the simple model

Blue Curve: Average value of $\hat{f}(x)$
for the complex model

Red Curve: True model ($f(x)$)

- Let $f(x)$ be the true model (sinusoidal in this case) and $\hat{f}(x)$ be our estimate of the model (simple or complex, in this case) then,

$$\text{Bias}(\hat{f}(x)) = E[\hat{f}(x)] - f(x)$$

- $E[\hat{f}(x)]$ is the average (or expected) value of the model
- We can see that for the simple model the average value (green line) is very far from the true value $f(x)$ (sinusoidal function)

Green Line: Average value of $\hat{f}(x)$ for the simple model

Blue Curve: Average value of $\hat{f}(x)$ for the complex model

Red Curve: True model ($f(x)$)

- Let $f(x)$ be the true model (sinusoidal in this case) and $\hat{f}(x)$ be our estimate of the model (simple or complex, in this case) then,

$$\text{Bias}(\hat{f}(x)) = E[\hat{f}(x)] - f(x)$$

- $E[\hat{f}(x)]$ is the average (or expected) value of the model
- We can see that for the simple model the average value (green line) is very far from the true value $f(x)$ (sinusoidal function)
- Mathematically, this means that the simple model has a high bias

Green Line: Average value of $\hat{f}(x)$
for the simple model

Blue Curve: Average value of $\hat{f}(x)$
for the complex model

Red Curve: True model ($f(x)$)

- Let $f(x)$ be the true model (sinusoidal in this case) and $\hat{f}(x)$ be our estimate of the model (simple or complex, in this case) then,

$$\text{Bias}(\hat{f}(x)) = E[\hat{f}(x)] - f(x)$$

- $E[\hat{f}(x)]$ is the average (or expected) value of the model
- We can see that for the simple model the average value (green line) is very far from the true value $f(x)$ (sinusoidal function)
- Mathematically, this means that the simple model has a high bias
- On the other hand, the complex model has a low bias

- We now define,

$$\text{Variance } (\hat{f}(x)) = E[(\hat{f}(x) - E[\hat{f}(x)])^2]$$

(Standard definition from statistics)

- We now define,

$$\text{Variance } (\hat{f}(x)) = E[(\hat{f}(x) - E[\hat{f}(x)])^2]$$

(Standard definition from statistics)

- Roughly speaking it tells us how much the different $\hat{f}(x)$'s (trained on different samples of the data) differ from each other

- We now define,

$$\text{Variance } (\hat{f}(x)) = E[(\hat{f}(x) - E[\hat{f}(x)])^2]$$

(Standard definition from statistics)

- Roughly speaking it tells us how much the different $\hat{f}(x)$'s (trained on different samples of the data) differ from each other
- It is clear that the simple model has a low variance whereas the complex model has a high variance

- In summary (informally)

- In summary (informally)
- Simple model: high bias, low variance

- In summary (informally)
- Simple model: high bias, low variance
- Complex model: low bias, high variance

- In summary (informally)
- Simple model: high bias, low variance
- Complex model: low bias, high variance
- There is always a trade-off between the bias and variance

- In summary (informally)
- Simple model: high bias, low variance
- Complex model: low bias, high variance
- There is always a trade-off between the bias and variance
- Both bias and variance contribute to the mean square error. Let us see how
