Module 3.1: Sigmoid Neuron

• Enough about boolean functions!

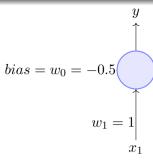

- Enough about boolean functions!
- What about arbitrary functions of the form y = f(x) where $x \in \mathbb{R}^n$ (instead of $\{0,1\}^n$) and $y \in \mathbb{R}$ (instead of $\{0,1\}$)?

- Enough about boolean functions!
- What about arbitrary functions of the form y = f(x) where $x \in \mathbb{R}^n$ (instead of $\{0,1\}^n$) and $y \in \mathbb{R}$ (instead of $\{0,1\}$)?
- Can we have a network which can (approximately) represent such functions?

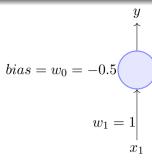

- Enough about boolean functions!
- What about arbitrary functions of the form y = f(x) where $x \in \mathbb{R}^n$ (instead of $\{0,1\}^n$) and $y \in \mathbb{R}$ (instead of $\{0,1\}$)?
- Can we have a network which can (approximately) represent such functions?
- Before answering the above question we will have to first graduate from *perceptrons* to *sigmoidal neurons* ...

Recall

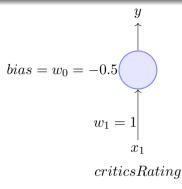

• A perceptron will fire if the weighted sum of its inputs is greater than the threshold $(-w_0)$

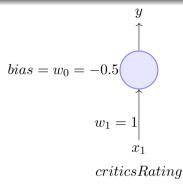

• The thresholding logic used by a perceptron is very harsh!

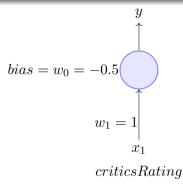

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie

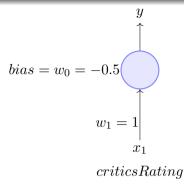

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$

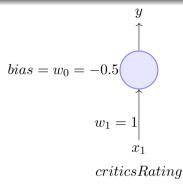

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$
- If the threshold is 0.5 ($w_0 = -0.5$) and $w_1 = 1$ then what would be the decision for a movie with criticsRating = 0.51?

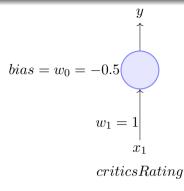

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$
- If the threshold is 0.5 ($w_0 = -0.5$) and $w_1 = 1$ then what would be the decision for a movie with criticsRating = 0.51? (like)

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$
- If the threshold is 0.5 ($w_0 = -0.5$) and $w_1 = 1$ then what would be the decision for a movie with criticsRating = 0.51? (like)
- What about a movie with criticsRating = 0.49?

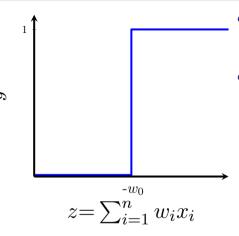

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$
- If the threshold is 0.5 ($w_0 = -0.5$) and $w_1 = 1$ then what would be the decision for a movie with criticsRating = 0.51? (like)
- What about a movie with *criticsRating* = 0.49? (dislike)

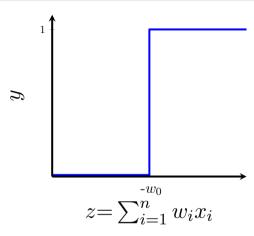

- The thresholding logic used by a perceptron is very harsh!
- For example, let us return to our problem of deciding whether we will like or dislike a movie
- Consider that we base our decision only on one input $(x_1 = criticsRating \text{ which lies between } 0 \text{ and } 1)$
- If the threshold is 0.5 ($w_0 = -0.5$) and $w_1 = 1$ then what would be the decision for a movie with criticsRating = 0.51? (like)
- What about a movie with *criticsRating* = 0.49? (dislike)
- It seems harsh that we would like a movie with rating 0.51 but not one with a rating of 0.49

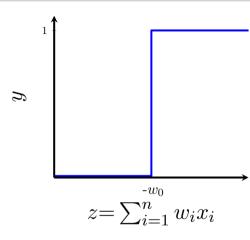

• This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose

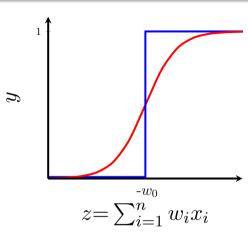

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function

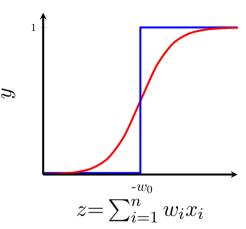

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function
- There will always be this sudden change in the decision (from 0 to 1) when $\sum_{i=1}^{n} w_i x_i$ crosses the threshold $(-w_0)$

- This behavior is not a characteristic of the specific problem we chose or the specific weight and threshold that we chose
- It is a characteristic of the perceptron function itself which behaves like a step function
- There will always be this sudden change in the decision (from 0 to 1) when $\sum_{i=1}^{n} w_i x_i$ crosses the threshold $(-w_0)$
- For most real world applications we would expect a smoother decision function which gradually changes from 0 to 1

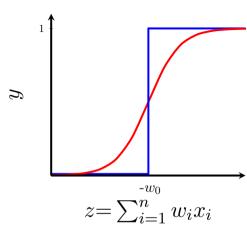

• Introducing sigmoid neurons where the output function is much smoother than the step function

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

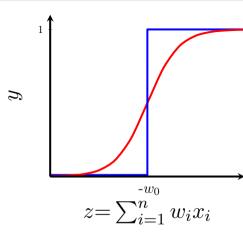

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^n w_i x_i)}}$$

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^{n} w_i x_i)}}$$

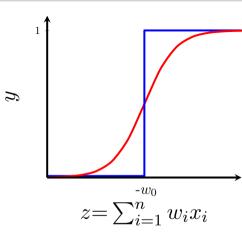

• We no longer see a sharp transition around the threshold $-w_0$

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^n w_i x_i)}}$$

- We no longer see a sharp transition around the threshold $-w_0$
- Also the output y is no longer binary but a real value between 0 and 1 which can be interpreted as a probability

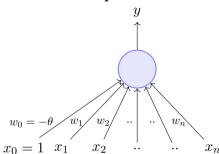

- Introducing sigmoid neurons where the output function is much smoother than the step function
- Here is one form of the sigmoid function called the logistic function

$$y = \frac{1}{1 + e^{-(w_0 + \sum_{i=1}^n w_i x_i)}}$$

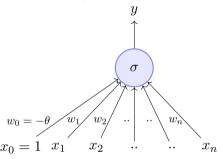

- We no longer see a sharp transition around the threshold $-w_0$
- Also the output y is no longer binary but a real value between 0 and 1 which can be interpreted as a probability
- Instead of a like/dislike decision we get the probability of liking the movie

Perceptron

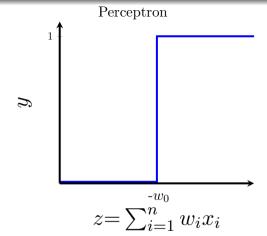

$$y = 1 \quad if \sum_{i=0}^{n} w_i * x_i \ge 0$$
$$= 0 \quad if \sum_{i=0}^{n} w_i * x_i < 0$$

Sigmoid (logistic) Neuron

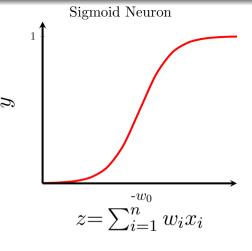

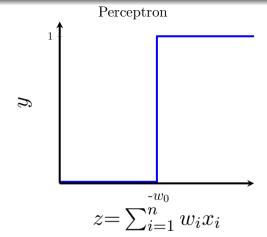

$$y = \frac{1}{1 + e^{-(\sum_{i=0}^{n} w_i x_i)}}$$

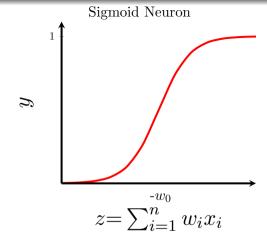

Not smooth, not continuous (at w0), **not**

differentiable

Not smooth, not continuous (at w0), **not** differentiable

Smooth, continuous, differentiable
